

Where Greece stands on the global ladder of sustainable waste management

by Nickolas J. Themelis, Chair of Global WtERT Council, Director, Earth
Engineering Center, Columbia University

After seventeen years of multiple efforts by multiple people, Greece still landfills millions of tons of municipal solid wastes, despite its relatively high GDP and scarcity of land that the rest of the world cherishes, as witnessed by nearly 30 million of annual visitors. This presentation will provide evidence that the time has come for Greece to build its first waste to energy plant in Attica, thus advancing the nation both environmentally and economically.
