Current situation

Polymer production and consumption of 2015:

[1]

- 4-6% of the global petroleum production was processed into polymer products
- This amounts to 322 Mt of polymer products
- Europe* produced 58 Mt and consumed 49 Mt
 - Germany 12,0 Mt (Greece 0,8 Mio. t)

[1]

*Europe in [1] consists of the 28 EU member states, Switzerland und Norway

Current situation

[1][2][3] [4]

Feedstock

- Feedstock criteria:
 - Non-hazardous
 - PO-content of at least 20 %
 - Mass flow of at least 20.000 t per year in Austria
- A PO-potential of up to 310.000 t per year was estimated
- Additionally about 2,2 Mt are estimated to be recoverable by landfillmining

Feedstock

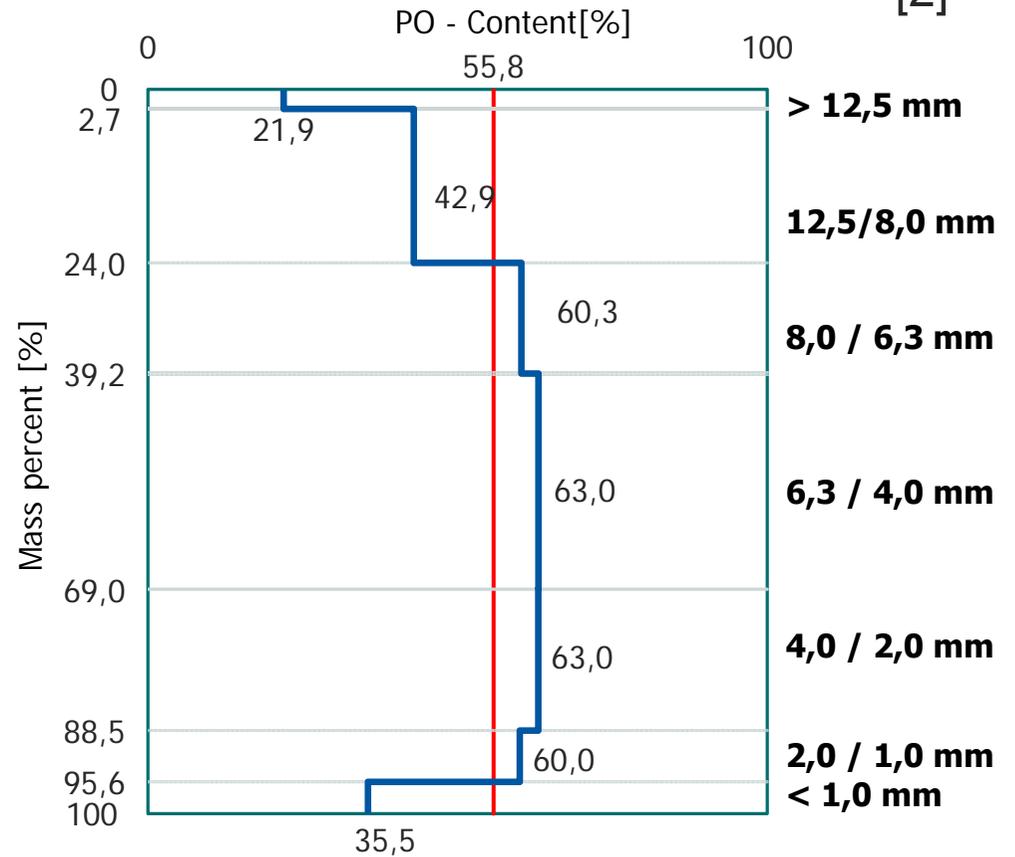

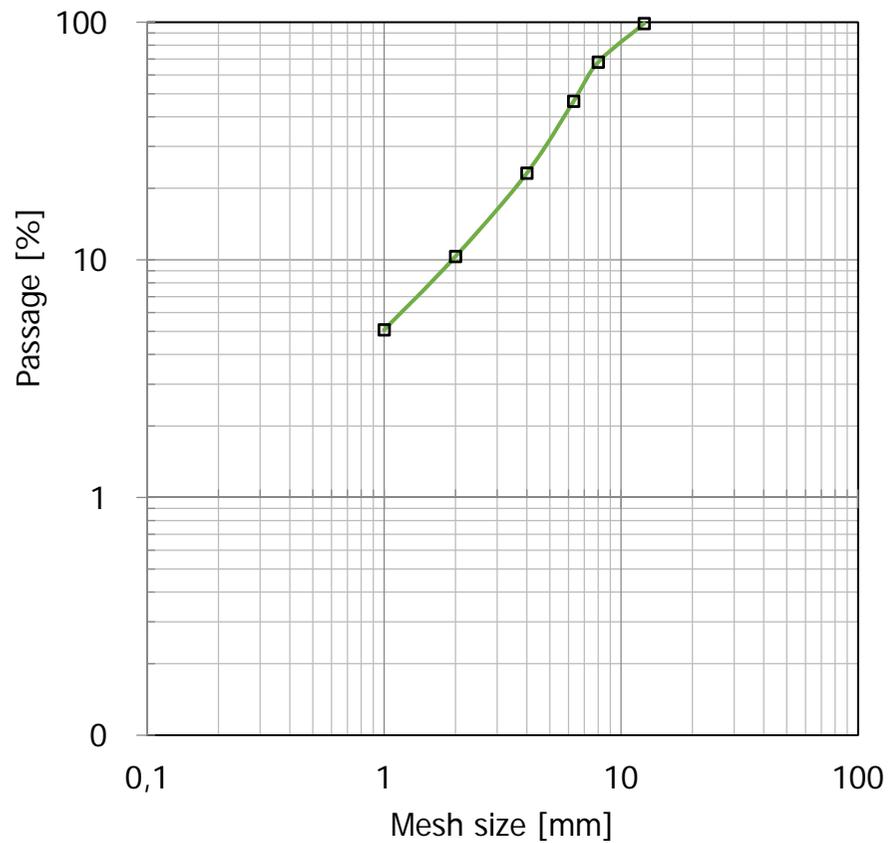

Particle size distribution

PO-distribution

[2]

Feedstock

Waste fraction A

Waste fraction B

Waste fraction C

Waste fraction	k_{80} [mm]	$\bar{g}_{PO,A}$ [%]
A	7,8	55,8
B	9,8	34,4
C	10,9	11,8

Conclusions

- The results show, that treating post-consumer plastic fractions by wet mechanical processing using a jig and multiple centrifugal force separators enable the separation of a highly pure PO-fraction.
- This light fraction has a PO-content of over 90% and is therefore suitable for feedstock recycling by thermochemical conversion.
- The processed middle and heavy fraction have the potential to be used for energy recovery.
- Therefore this process can be used as a bridge technology to make additional shares of post-consumer plastics, especially polyolefins, available for feedstock recycling and to be a first step towards the proposed EU's goal of 55 % material plastic recycling by the year 2025.
