Introduction

Enormous stream of C&D Wastes are generated annually.

Quantities generated in Europe in 2012 reached the amount of 383 millions tones (Eurostat, 2016), 50 million tons of which was RAP- Recycled Asphalt Pavement (Dinis-Almeida M. and Afonso M.L., 2015).

[Diagram showing percentage breakdown of C&D waste]

Quantitative targets Joint Ministerial Decision 36259/1757/2010

1/1/2012
> 30%
Reuse, recycling, recovery

1/1/2015
> 50%
Reuse, recycling, recovery

1/1/2020
> 70%
Reuse, recycling, recovery
We want Sustainable development + reducing extraction of natural resources

We have C&D Wastes + reduction of quantities of natural resources (aggregates and bitumen)

SO → many countries through industry are trying to incorporate best practices concerning the use of alternatives in road construction and especially WARM MIX ASPHALT.
Existing know how on Warm Mix Asphalt and RAP

http://insideclimatenews.org/sites/default/files/carbon-emissions.jpg

Worldwide, studies aim at the examination of new technologies which may lead to reduction in mixing energies & the emission of CO₂ by examining at the same time basic properties of the produced mixtures & reduction of the materials quantity doomed to landfills.
According to test results,

1) Use of recycled aggregates lead to a reduction of raw aggregates and 47% reduction in CO$_2$ during a case study concerning rehabilitation methods in pavements in a major airport in Italy (Magnoni et al, 2016).

2) Reducing the manufacture temperature of bituminous mixtures leads to lower fuel consumption and cost by 25-35%. At the same time an important reduction of greenhouse emissions (CO$_2$ emitted can be reduced between 25 and 40%), as well as in the emissions of CO and NO$_x$ (Carvalho και Barreno, 2013).
Warm mix asphalt with RAP, produced at lower mixing temperatures than conventional ones, showed improved stiffness modulus and fatigue resistance. Mixture produced with RAP did not contain any additive to improve the aged bitumen performance [Dinis-Almeida M. and Afonso M.L., (2015)].

It is possible to manufacture Roller Compacted Concrete (RCC) with a maximum of 50% of RAP materials for road construction (Settari et al, 2015).

Existing technology allows utilization of ~100% RAP (Ammann-Group, 2010).
Experimental part

Materials used for the experimental part of current research were:

- Bitumen 50/70 (Hellenic Petroleum S.A)
- Natural aggregates (sizes 0/16mm originated by the quarry of Lafarge Beton ABEE in Messaio, and quarry of Pavlidis SA in Plagiari Giannitson).
- RAP (originated from road works near the area of Central Macedonia supplied by Anakyklosis Adranon Voreiou Ellados SA) and
- Asphaltite (Selenizza) (supplied by Tsakas Ltd)

The design of bituminous mixtures follows Greek Specifications of bituminous type AC12.5 according to ELOT Technical Specification 1501-05-03-11-04:2009.

AC12.5 is a bituminous mixture of dense/closed type and is used for surface layers due to the finesse of the aggregates used.
Production of RAP can be made by the use of special equipment, i.e. bitumen cutter. This can be accomplished either by scraping the asphalt layers to the desired thickness, in order to restore it or by the use of an excavator, which removes big particles of pavement (including subbase/base).

Experimental part

TESTING RAW MATERIALS - RAP

http://img.directindustry.com/images_di/photo-g/41149-3954987.jpg

http://media.wirtgen-group.com/media/01_wirtgengroup/news_and_press_releases/2014_wirtgen_road_technology_days/W50Ri_01223_HI_961x0.jpg
- RAP is not seen as a waste, but as a material that carries valuable characteristics and that can preserve conventional aggregates for the next generations.

- **Reduction in cost** for the production of bituminous mixtures since less energy is needed for the **heating of the aggregates** as well as the **reduction in quantities of raw materials needed**.

- Many industries which produce asphalt mixtures are investing on the development of innovative technology achieving production of new bituminous mixtures by the use of 100% of RAP.
The bitumen of Selenizza® is contained in an asphaltite ore substance and is extracted from underground galleries or open pit mines at the deposit of Selenice (Albania).

Under this form, it is called natural bitumen and after a refining process, the obtained clean bitumen is known under the trade name of Selenizza®.

Asphaltite is used as a modifier of bitumen 50/70, so it is expected to influence bitumen’s properties.

Less irregularities
Conventional bituminous mixture with bitumen 50/70 satisfies the demands for bituminous layers in places of heavy circulation as set by Greek Specifications ELOT TS 501-05-03-11-04:2009.

Addition of asphaltite at percentage of 12%w/t of bitumen improves not very significant, as expected, mechanical properties of the mixtures.

Addition of RAP at percentage of 30% w/t of the aggregates leads to a significant improvement of the whole list of properties.

**Combined use of RAP and asphaltite** seems to **improve further** mixtures’ properties apart from depth of rut, even though rate of rutting is improved.
CONCLUSIONS

Asphaltite’s disadvantages:

- high cost (750€/tn vs~200 €/tn of bitumen 50/70
- operational costs since it is more time consuming as well as its origin, which is found in Albania.

RAP’s advantages:

- properties of the mixtures are improved
- cost is decreased since less bitumen and quantity of natural resources are used for the production of the final mixture and
- waste is exploited and
- natural resources are saved for next generations.
Unfortunately, Greek legislation allows at the moment the use of RAP at percentage up to

- 10%w/t of the aggregates for surface bituminous layers and
- 20% for lower layers.

Entering of higher percentages of RAP in Greek legislation and combined use of RAP and RA (Recycled Aggregates) for even higher environmental benefit will be examined further.

*Even a slight increase of percentage of RAP used in bituminous mixtures is beneficial and can also lead to the achievement of goals as are set by the Greek legislation (GMD36259/1757/E103/24-08-2010) which demands the reuse and recycling of 70% of C&D Wastes by 2020.*
