

# The feasibility of integrating biomass steam gasification and syngas biomethanation to store renewable energy as methane gas

Lorenzo Menin, Stergios Vakalis, Vittoria Benedetti, Francesco Patuzzi, Marco Baratieri

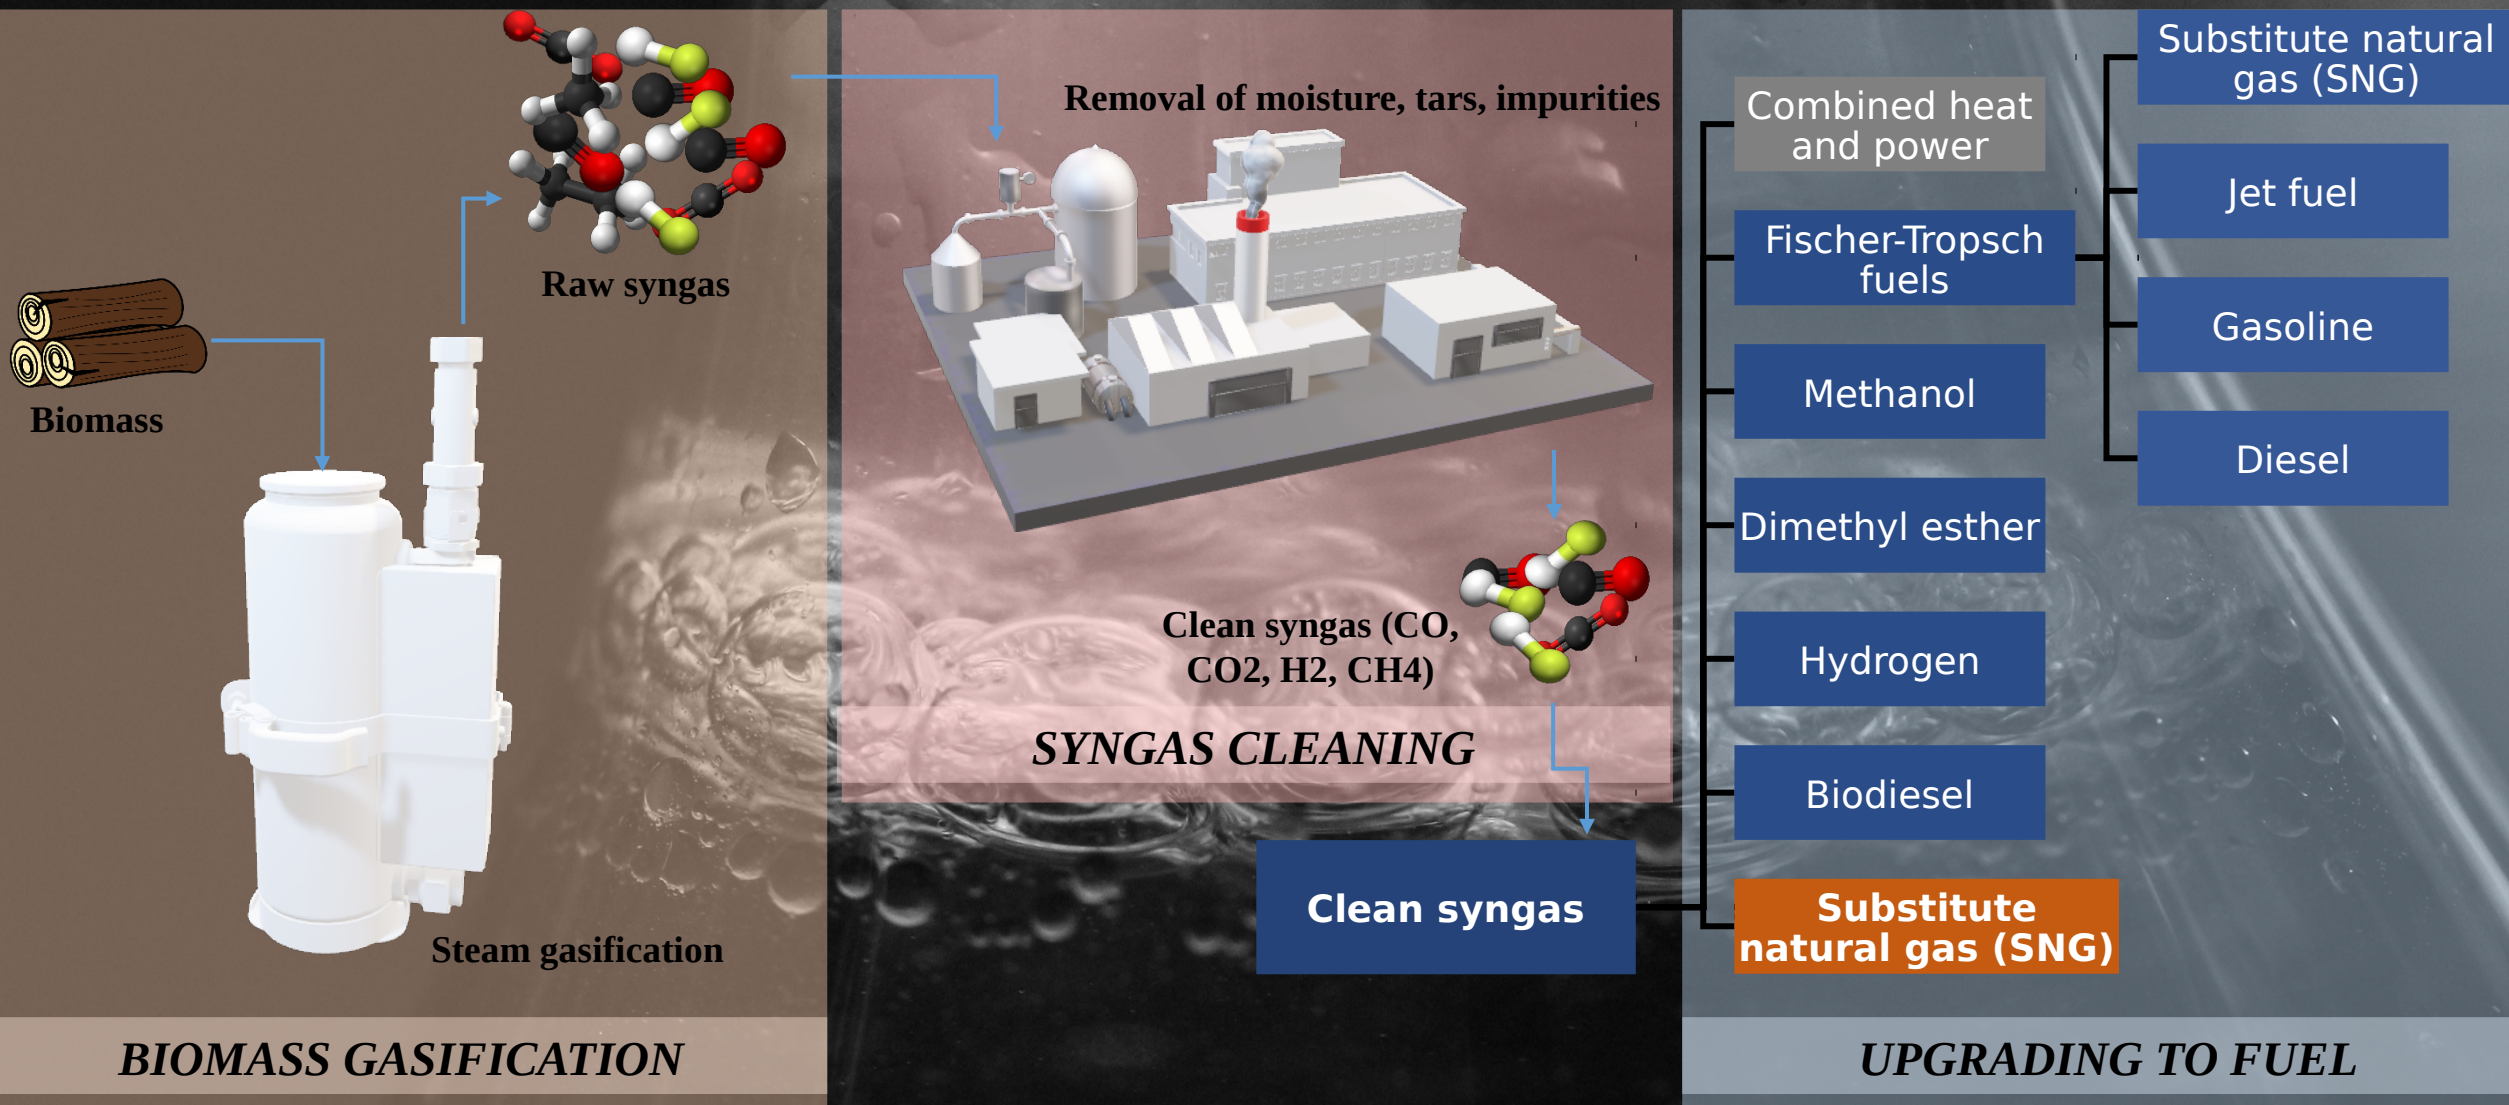

## A glance at future renewable energy systems

- Multiple sectors will require **diverse renewable fuels**  
and
- Fuels with **high storage capacity** will be required to grant temporal flexibility

Thus, sole **heat and power** production from biomass will not be appropriate: biomass conversion has to shift towards the synthesis of **versatile, storable, transportable fuels**

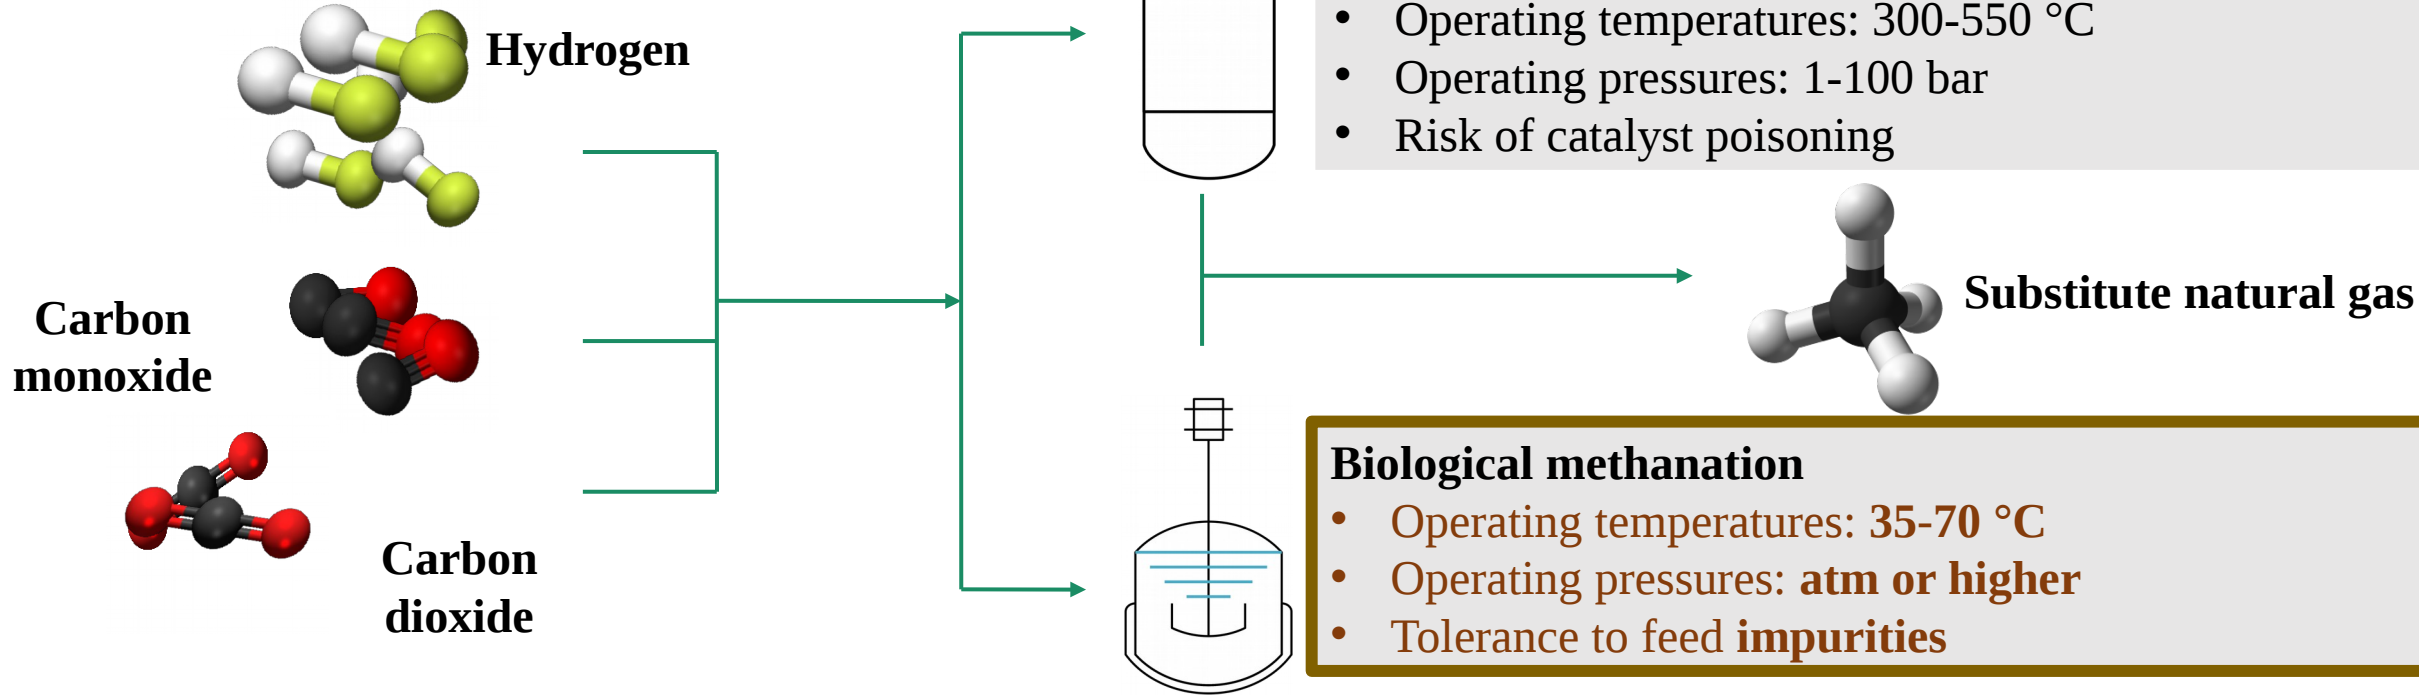

# High-quality fuels from biomass gasification

- **High volumetric energy content :**  
 $\text{vs } \text{LHV}_{\text{CH}_4} : 33 \text{ MJ/Nm}^3 \text{ vs } \text{LHV}_{\text{H}_2} : 10 \text{ MJ/Nm}^3$
- **Existing transport and storage infrastructure**
- **Established combustion and conversion technologies across sectors**

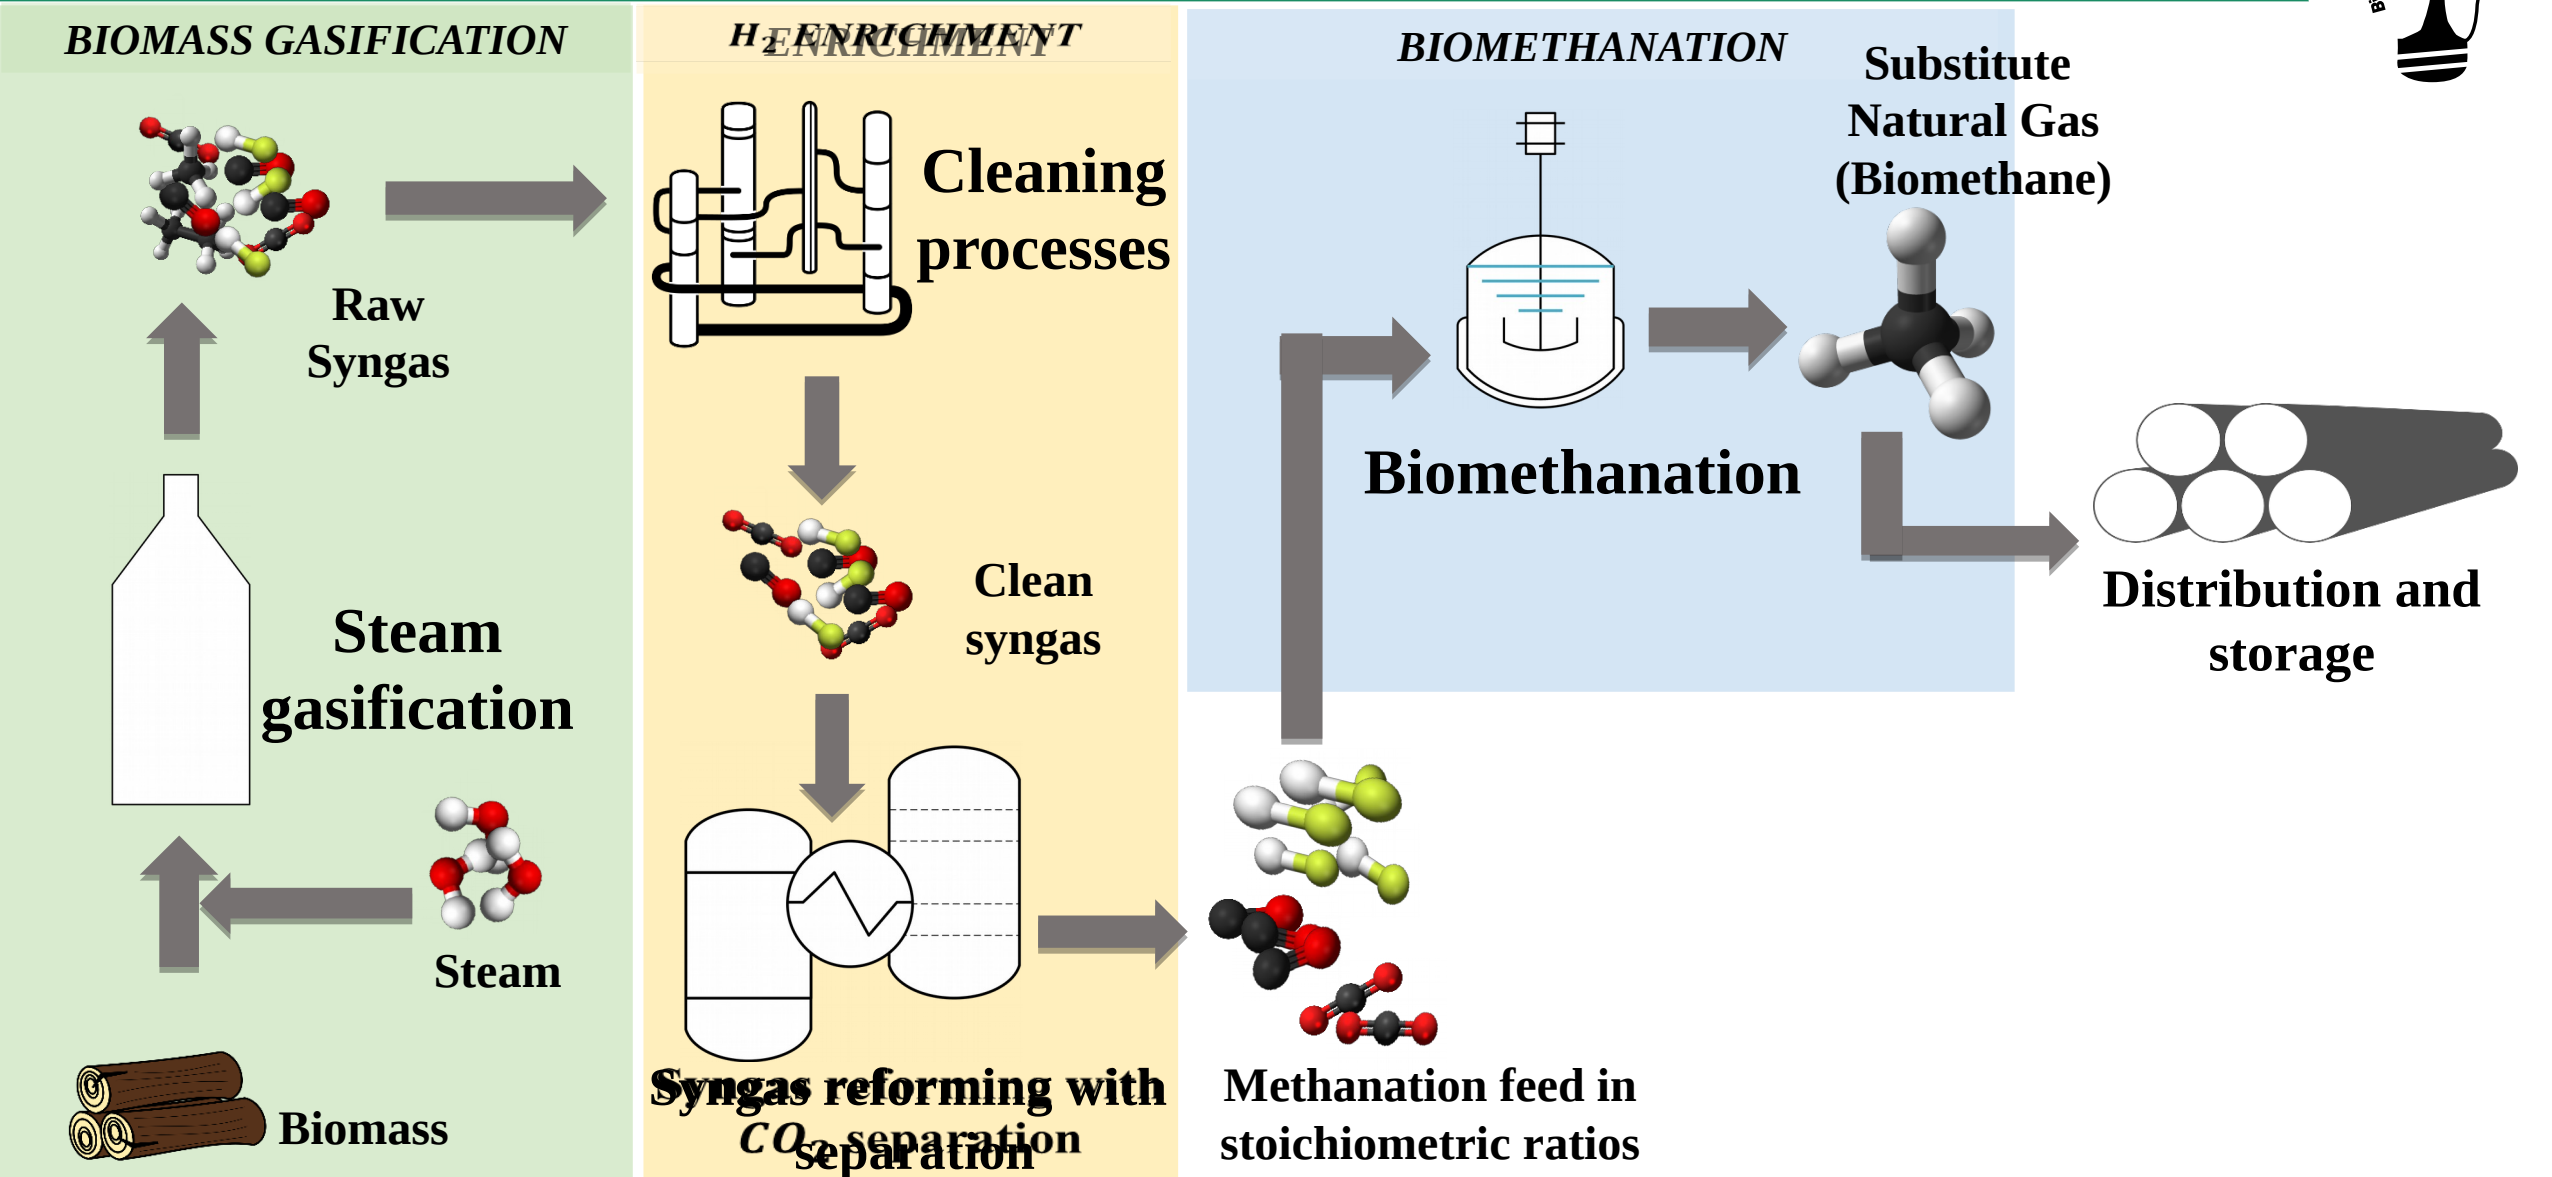

«Natural gas offers many potential benefits [...] given limits to how quickly renewable energy options can **scale up** and that cost-effective zero-carbon options can be **harder to find in some parts of the energy system**. The **flexibility** that natural gas brings to an energy system can also make it a good fit for the rise of **variable renewables** such as wind and solar PV»

**CATALYTIC OR BIOLOGICAL METHANATION**

# Biomethanation of syngas: Substitute Natural Gas from biomass

## Key feasibility questions

1. Yield of biomethane?
2. Overall production capacity?
3. Energy efficiency?
4. Product **minimum selling price**?
5. Desirability of **biomethane** compared to **hydrogen**?

## Study objectives

Define a **Biomass-to-Biomethane** system (A) and a **Biomass-to-Hydrogen** system (B), both supplemented by **water electrolysis**.

And for both systems:

1. Estimate the **system mass balance and production capacity**
2. Estimate the **system energy balance and efficiency**
3. Estimate the **minimum selling price** of the products
4. Identify system **optimization requirements**

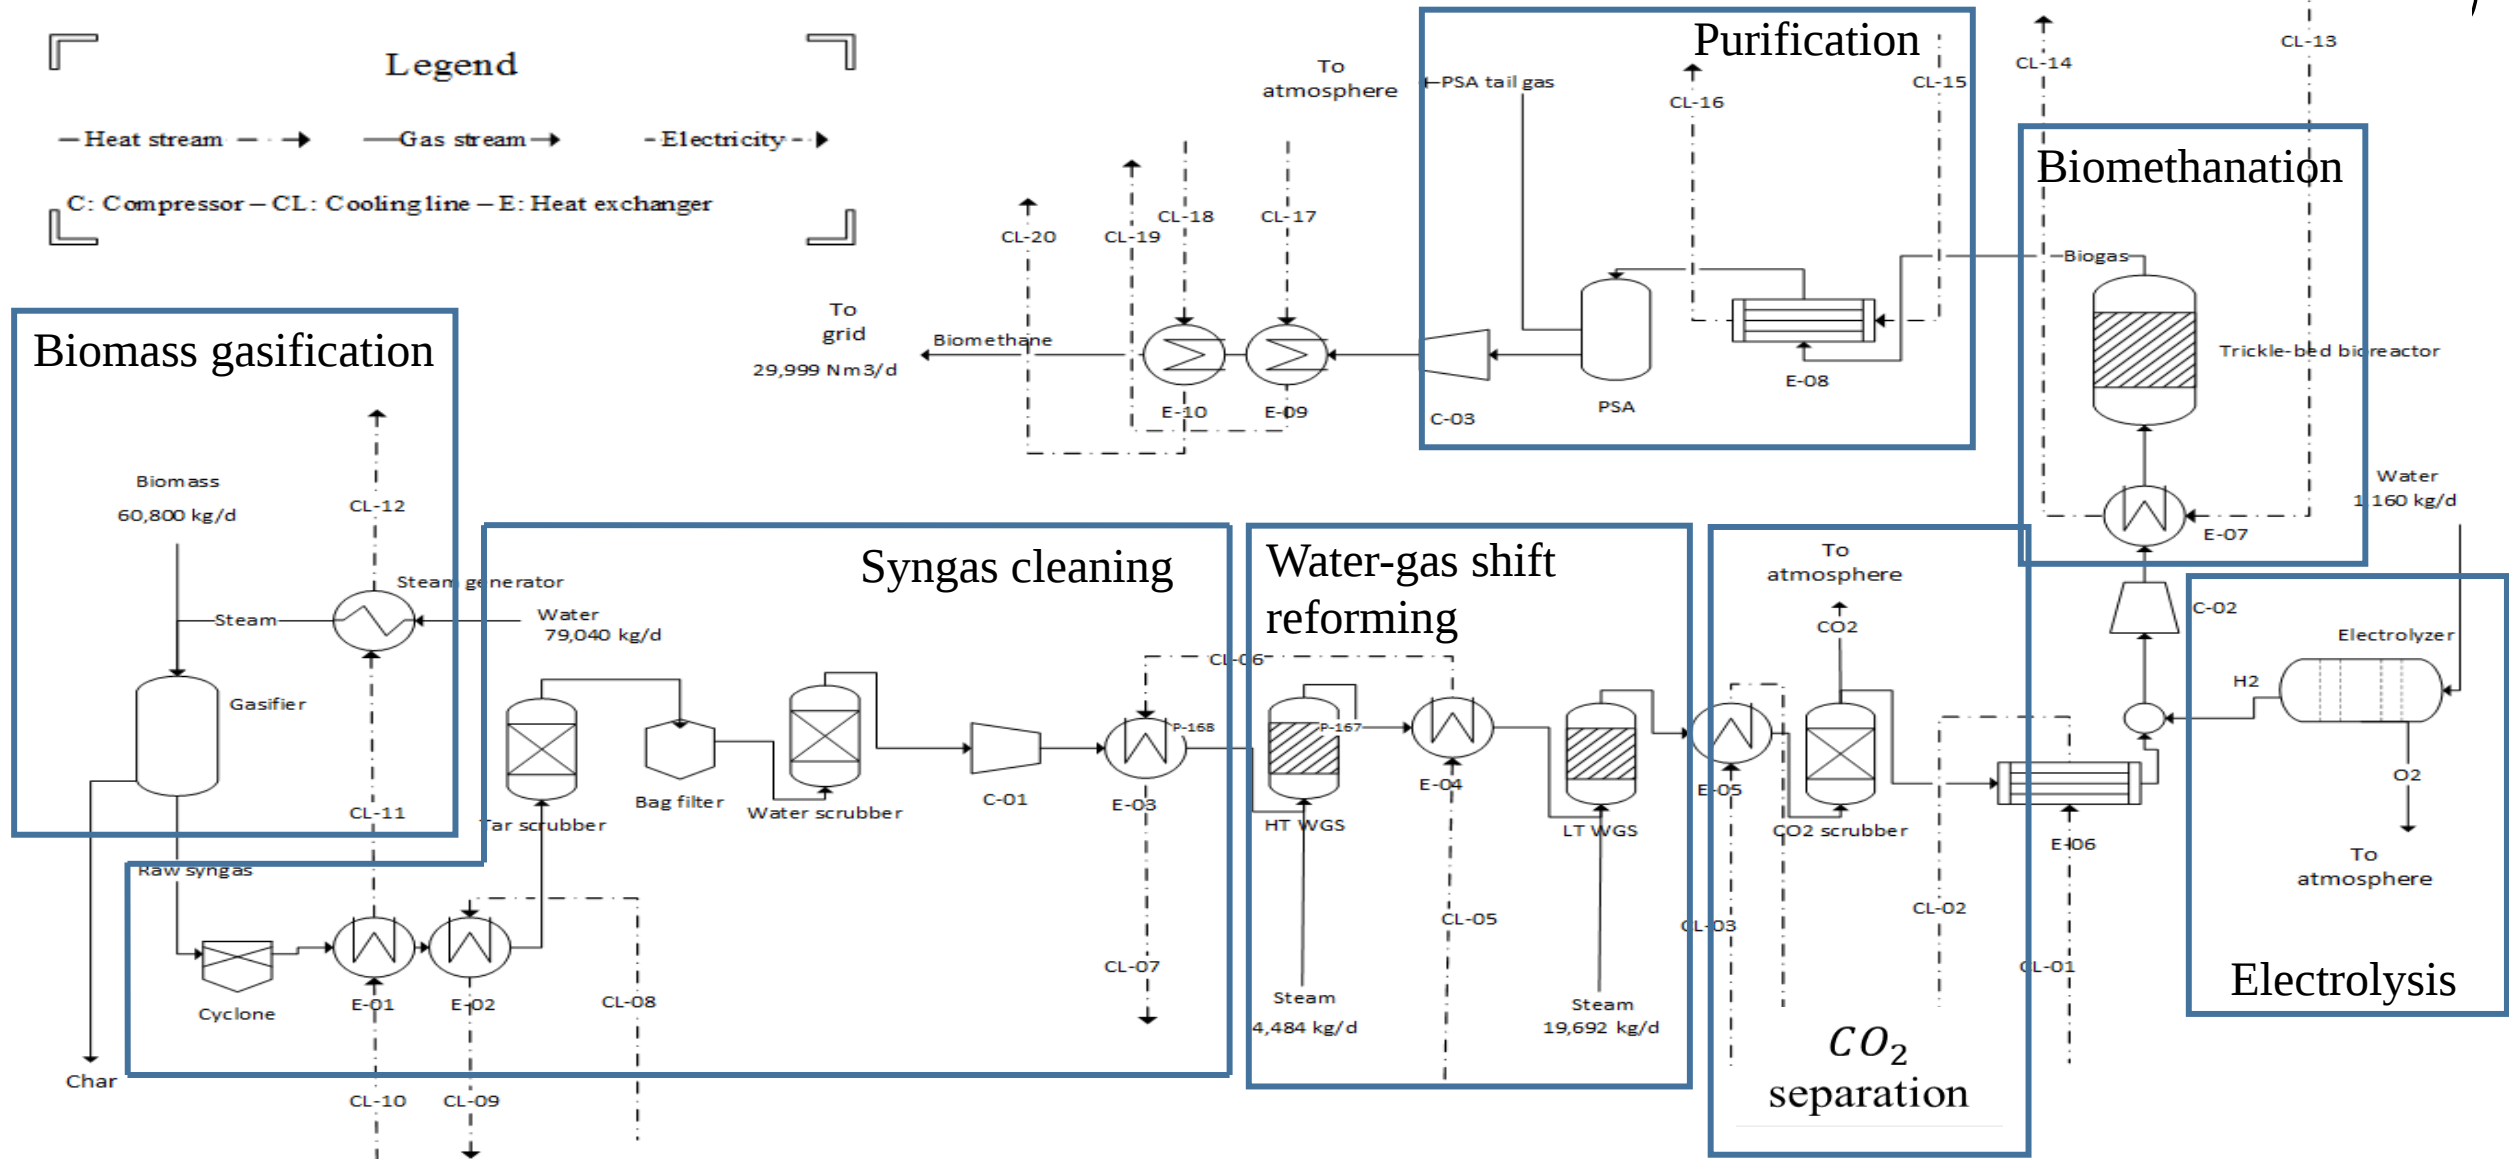

# System A: Biomass-to-Biomethane

 E: Heat exchanger

# System B: Biomass-to-Hydrogen

# Process techno-economic parameters

Process section	Parameter	Value	Reference
Dual fluidized bed gasifier	Cold gas efficiency calculated on syngas lower heating value	72%	Ptasinski (2015)
	Share of excess electricity input	30%	Technical assumption
Alkaline water electrolysis	Share of grid electricity input	70%	
	Specific electrical consumption	4.6 kWh/Nm <sup>3</sup> H <sub>2</sub>	
Biomethanation	Hydrogen conversion rate	97%	Rachbauer <i>et al.</i> (2016)
Pressure swing adsorption	Methane recovery rate	90%	Augelletti <i>et al.</i> (2017)
	Hydrogen recovery rate	85%	Yao <i>et al.</i> (2017)
Water-gas shift reforming	Low-temperature carbon monoxide conversion rate	47%	Thermodynamic model in Matlab with empirical correlations based on literature data
	High-temperature carbon monoxide conversion rate	59%	

# Process financial assumptions and parameters

Parameter	Value
<b>General financial assumptions</b>	
Plant lifetime	20 years
Tax rate	35%
Discount rate	7%
<b>Materials, utilities, labor</b>	
Biomass cost	100 €/t
Char disposal cost	150 €/t
Labor	24.87 €/man-hour
Natural gas	0.03 €/kWh
Full-price electricity	0.09 €/kWh
Surplus renewable electricity	0.05 €/kWh

System ID	Product type	Input			Output	
		Biomass	Liquid water	Steam	Biomethane	Hydrogen
			kg/day		Nm <sup>3</sup> /day	kg/day
<b>A</b>	Biomethane	60,800	1,160	103,217	<b>26,999</b>	-
<b>B</b>	Hydrogen	60,800	1,160	103,217	-	<b>4,037</b>

## Important comparisons

Typical production of European anaerobic digestion biogas plant: 12,000 - 14,000 Nm<sup>3</sup>/day of biogas

Typical consumption of European ammonia production plant: 160,000 - 150,000 kg/day

Typical consumption of European oil refinery: 20,000 - 30,000 kg/day

System ID	Product type	Hydrogen utilization	Yield on dry biomass	Yield on carbon or hydrogen
			Nm <sup>3</sup> SNG/kg biomass	mol CH <sub>4</sub> /mol C
<b>A</b>	Biomethane	97.5%	<b>0.44</b>	0.45
			kg H <sub>2</sub> /kg biomass	mol H <sub>2</sub> /mol H <sub>2</sub>
<b>B</b>	Hydrogen	85.0%	<b>0.07</b>	0.35

## Major conversion limitations with respect to carbon (A) and hydrogen (B) inputs

**Process A:** - carbon losses in CO<sub>2</sub> scrubbing

**Process B:** - hydrogen losses in PSA tail gas

- steam conversion limitations in gasification and water gas shift reforming

- moisture removal

System ID	Product type	Energy input			Energy output	Efficiency
		Biomass	Thermal	Electrical		
					Product LHV	Cold gas efficiency
		MW				-
<b>A</b>	Biomethane	13	2.1	2.3	10.2	58.4%
<b>B</b>	Hydrogen		<b>0.8</b>	<b>1.5</b>	5.6	36.6%

## Energy recovery from PSA tail-gas combustion in Process B

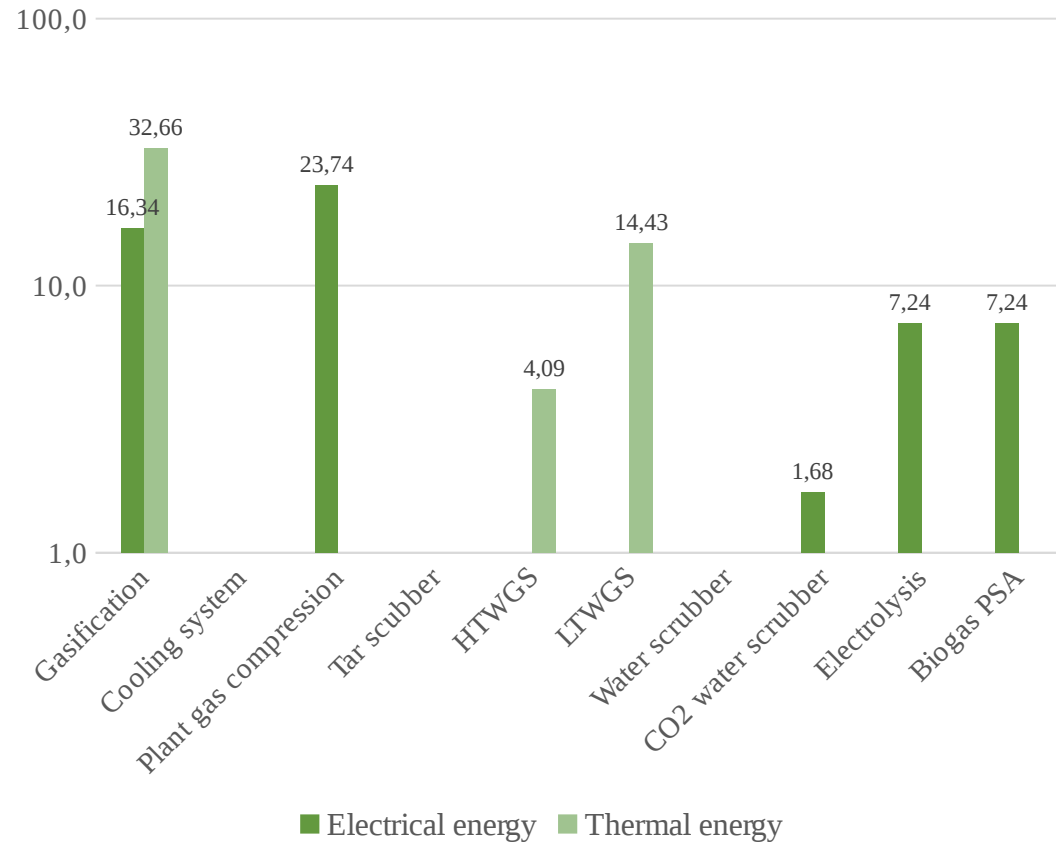

Electricity: 1.39 MW

High-temperature heat: 2.91 MW

## Energy consumption (MWh/day)

### System A (Biomethane)

### Greatest electrical energy requirements

1. Gas compression (42%)
2. Gasification (29%)
3. Pressure Swing Adsorption (13%)

### Greatest thermal energy requirements

1. Gasification steam (64%)
2. Water-gas shift steam (28%)

## Energy consumption (MWh/day)

### System B (Hydrogen)

### Greatest electrical energy requirements

1. Gas compression (45%)
2. Gasification (23%)
3. Pressure Swing Adsorption (19%)

### Thermal energy requirements

Water-gas shift units are only source of heat demand, thanks to PSA tail-gas combustion and heat integration

## Product minimum selling price and current market prices

		Minimum selling price		Current market prices	
System	Product	Product unit	Energy unit	Product description	Product unit price
A	Biomethane	2.37 €/Nm <sup>3</sup>		Biomethane from AD of waste and by-products	0.83 €/Nm <sup>3</sup>
B	Hydrogen				

<sup>(1)</sup> Through biomass gasification and CHP production; <sup>(2)</sup> Before delivery

## Product minimum selling price and current market prices

		Minimum selling price		Current market prices	
System	Product	Product unit	Energy unit	Product description	Product unit price
A	Biomethane	2.37 €/Nm <sup>3</sup>	0.26 €/kWh	Biomethane from AD of waste and by-products	0.83 €/Nm <sup>3</sup>
				Biomass-derived <sup>(1)</sup> renewable electricity	0.16 €/kWh – 0.27 €/kWh
B	Hydrogen				

<sup>(1)</sup> Through biomass gasification and CHP production; <sup>(2)</sup> Before delivery

## Product minimum selling price and current market prices

		Minimum selling price		Current market prices	
System	Product	Product unit	Energy unit	Product description	Product unit price
A	Biomethane	2.37 €/Nm <sup>3</sup>	0.26 €/kWh	Biomethane from AD of waste and by-products	0.83 €/Nm <sup>3</sup>
				Biomass-derived <sup>(1)</sup> renewable electricity	0.16 €/kWh – 0.27 €/kWh
B	Hydrogen	15.45 <sup>(2)</sup> €/kg	0.46 €/kWh		

<sup>(1)</sup> Through biomass gasification and CHP production; <sup>(2)</sup> Before delivery

## Product minimum selling price and current market prices

		Minimum selling price		Current market prices	
System	Product	Product unit	Energy unit	Product description	Product unit price
A	Biomethane	2.37 €/Nm <sup>3</sup>	0.26 €/kWh	Biomethane from AD of waste and by-products	0.83 €/Nm <sup>3</sup>
				Biomass-derived <sup>(1)</sup> renewable electricity	0.16 €/kWh – 0.27 €/kWh
B	Hydrogen	15.45 <sup>(2)</sup> €/kg	0.46 €/kWh	Technical grade hydrogen (before delivery)	8.54-10.98 €/kg
				Technical grade hydrogen (after mid-range delivery)	11 – 13 €/kg

<sup>(1)</sup> Through biomass gasification and CHP production; <sup>(2)</sup> Before delivery

Among the two systems analyzed:

1. Biomass-to-Biomethane (system A) shows
  - a) a **higher yield on biomass**
  - b) a **more efficient utilization of the hydrogen input**
  - c) an overall **higher cold gas efficiency production capacity**
2. Biomass-to-Hydrogen (system B) offers **better heat integration opportunities**, thanks to PSA tail gas combustion

3. The **renewable energy subsidies** required to make syngas biomethanation feasible are **comparable with those currently in place** for on-site syngas combustion for CHP in Italy
  
4. Biomass-to-Biomethane provides **higher production capacities and lower delivery costs** than hydrogen purification: better option for biomass gasification
  
5. Key process optimization areas include:
  - a) **Steam-to-hydrogen conversion** in gasification and syngas reforming processes
  - b) Process operation at **lower pressures** to reduce power inputs
  - c) Better **heat integration** in Biomass-to-Biomethane processes

The authors would like to thank a group of industrial professionals for their useful advice:

- Simone Menato (Sebigas)
- Florian Irschara (BTS)
- Alberto Dicorato (Sulzer)
- Massimiliano Coslovich and Marco Possenelli (SIAD)

## Model assumptions:

- Single adiabatic reactors at 15 bar pressure
- Water-gas shift is only reaction taking place:  $CO + H_2O \leftrightarrow CO_2 + H_2$
- High-temperature WGS: 350 °C; Low-temperature WGS: 200 °C

## Iteration set-up in Matlab with Cantera thermodynamic database

Adiabatic process assumption:  $H_{feed} = H_{product}$

$$\frac{K}{K_{ref}} = \exp \left[ \frac{\Delta H_0}{R} \left( \frac{1}{T} - \frac{1}{T_{ref}} \right) \right]$$

$T$  = adiabatic reactor temperature  
 $X_{eq}(T)$  = equilibrium conversion

**BUT**

$$X_{real}(T) < X_{eq}(T)$$

Correct by means of empirical correlations as function of reaction temperature:

$$\Delta\chi = \chi_{eq} - \chi_{real} = f(T)$$

Reaction type	Correlation function	Ref.
High temperature WGS	High temperature WGS $\Delta\chi = 745.8 \exp(-0.02 T)$ ( $R^2 = 0.99$ )	Rauch <i>et al.</i> (2015)
	Low temperature WGS $\Delta\chi = 6.26 \exp(-0.01 T)$ ( $R^2 = 0.97$ )	Jeong <i>et al.</i> (2014)
Low temperature WGS	High temperature WGS $\Delta\chi = 745.8 \exp(-0.02 T)$ ( $R^2 = 0.99$ )	Rauch <i>et al.</i> (2015)
	Low temperature WGS $\Delta\chi = 6.26 \exp(-0.01 T)$ ( $R^2 = 0.97$ )	Jeong <i>et al.</i> (2014)
