Energy Savings & Reduced Emissions in Combined Natural & Engineered Systems for Wastewater Treatment & Reuse: The WWTP of Antiparos Island, Greece

P-M. Stathatou, P. Dedousis, G. Arampatzis, H. Grigoropoulou & D. Assimacopoulos

School of Chemical Engineering, National Technical University of Athens, Greece

6th International Conference on Sustainable Solid Waste Management, Naxos Island, Greece, 13–16 June 2018
Why Combining Natural & Engineered Treatment Systems?

Europe’s water service providers struggling to deliver improved & affordable water services

- Continuous population growth
- Climate change

Natural water treatment processes

- Ecological & socio-economic advantages over purely engineered systems
  - Lower operational costs & energy requirements
  - Conservation of natural environment
  - Zero visual obstruction

- Performance limitations
  - Low temperatures
  - Space restrictions
  - Long residence times
  - Flow variations during floods and droughts

Combination of natural with engineered treatment processes to overcome limitations, improve performance & increase treatment resilience of natural processes
Research on Combined Natural & Engineered Treatment Systems (cNES)

Investigating & assessing the potential advantages of cNES over purely engineered treatment systems in delivering safe, reliable and efficient water services

Aim of the study
- Assess cNES advantages for wastewater treatment and reuse, focusing on the energy savings and the reduction of GHG emissions
- Demonstrate the feasibility of cNES to obtain water for irrigation of public spaces in isolated insular communities and small municipalities
The Study Site Area
Antiparos Island, Greece

**Location & Administration**
- Located in the Cyclades complex of the Aegean sea
  - Area: 35.10 km²
  - Permanent population: 1,211 inh. (census 2011)
  - Seasonal residents & tourists: 1,000 (2012)
- Administration: Municipality of Antiparos
  - Public entity
  - Part of the Regional Unit of Paros

**The Problem of Untreated WW**
- Drivers
  - Lack of infrastructure
  - Isolated location
  - Rapid tourism development
- Impacts on natural & socio-economic environment
  - Groundwater & marine contamination
  - Development issues & impacts on tourism

**Suggested Solution**
- *The WWTP of Antiparos*
The WWTP of Antiparos Island

- Constructed in May 2015 for the treatment & reuse of municipal wastewater
- Located at Sifneikos Gyalos
  - Area: 28,400 m²
- Mean daily design capacity (year 2035)
  - 240 m³/d during winter (1,500 p.e.)
  - 480 m³/d during summer (3,000 p.e.)
Flow Scheme of the Antiparos cNES

- **Raw wastewater**
  - Pre-Treatment
  - Flow Equalization
  - Primary Sedimentation

- **2-Stage Constructed Wetlands**
  - CW Stage I (4 Beds)
  - CW Stage II (2 Beds)

- **Stabilization pond**

- **Irrigation of public spaces**
- Storage tank
- Dechlorination
- Chlorination

- Additives:
  - $\text{Na}_2\text{S}_2\text{O}_3$
  - $\text{NaOCl}$
The Adopted Methodology
1. Modeling of the Antiparos cNES (Baseline Scenario)

○ Integrating software modelling & simulation environment
  ○ Building a cNES by integrating libraries for the modeling of engineered & natural treatment processes & their interactions
  ○ Evaluating the quantity & quality of wastewater, the generated sludge & emissions, the energy consumed & the chemicals used

○ Model assumptions
  ○ Winter duration: 8 months (245 days)
  ○ Summer duration: 4 months (120 days)
  ○ Generated sludge at pre-treatment stage: 0.03 L/m³
  ○ Primary sedimentation: 55% reduction of TSS and 35% reduction of BOD₅

---

2. Design of an Activated Sludge Process for the Antiparos WWTP (Alternative Scenario)

- Substitution of CWs & stabilization pond with a conventional activated sludge process (CAS)
  - Anoxic tank for effluent nitrification / denitrification
  - Aeration tank - bioreactor
  - Submerged aeration diffusers
  - Secondary clarifier - settling tank

- The CAS was designed to achieve the same effluent quality with the CWs
  - BOD5, TSS, TN and TP

- The whole system was modelled to reach the same effluent quality at the outlet with the baseline scenario
  - BOD5, TSS, TN, TP, and E. Coli

</tr>
<tr>
<td>◦ Calculation of daily &amp; annual energy consumption for WW aeration (kWh/d &amp; kWh/yr.)</td>
</tr>
<tr>
<td>◦ Aeration flow requirement</td>
</tr>
<tr>
<td>◦ Selection of submerged aeration diffusers of suitable capacity for air diffusion in the aeration tank</td>
</tr>
<tr>
<td>◦ Aeration blower power requirements for the selected submerged aeration diffusers</td>
</tr>
</tbody>
</table>
4a. Calculation of On-Site GHG Emissions

*On-site GHG emissions are generated by the biological treatment processes*

**Baseline Scenario - CWs**
- CH₄ emissions in methanogenesis
  - Organic material load in CWs
- N₂O in nitrification / denitrification of N compounds by microorganisms
  - TN load in CWs

**Alternative Scenario - CAS**
- CO₂ emissions from biomass decay and oxidation
- N₂O emissions from denitrification processes

The IPCC (2014) GWP values relevant to CO₂ for 100-year time horizon were considered
- CH₄: 28
- N₂O: 265
4b. Calculation of Off-Site GHG Emissions

*Off-site GHG emissions are generated by the production of the electricity consumed by the plant*

- Antiparos island was considered to be part of the non-interconnected system
Assessment Results
1. Treatment Performance of the Antiparos cNES (Baseline Scenario)

- Substantial contribution of CWs in the treatment - significant pollutant reduction
  - BOD5 96%
  - TSS 98%
  - TN 77%
  - TP 14%

- Pathogen elimination by combining CWs, maturation pond & disinfection
  - 88% of pathogens were removed after CWs
  - 96% of pathogens entering the stabilization pond were removed

- The limits of the Greek Reuse Legislation for restricted irrigation are met - reliable performance of the system
Pollutant Removal in the Antiparos cNES
E. Coli Removal in the Antiparos cNES
2. The CAS System for the Antiparos WWTP (Alternative Scenario)

- CAS for secondary treatment instead of CWs & maturation pond to achieve the same effluent quality with the baseline scenario

3. Comparison of Scenarios: Energy Consumption
4a. Comparison of Scenarios: On-Site GHG Emissions

- **Baseline Scenario - CWs**
  - 15.50 kg CO₂ e/d on winter days
  - 31 kg CO₂ e/d on summer days

- **Alternative scenario - CAS**
  - 108.00 kg CO₂ e/d on winter days
  - 120.00 kg CO₂ e/d on summer days

- **On-site emissions from CAS about 5 times greater than those from CWs**
4b. Comparison of Scenarios: Off-Site GHG Emissions

- **Baseline Scenario - CWs**
  - 0.20 kg CO₂ e/d on winter days
  - 0.40 kg CO₂ e/d on summer days

- **Alternative scenario – CAS**
  - 775.00 kg CO₂ e/d on winter days
  - 1,515.00 kg CO₂ e/d on summer days

- **Off-site emissions from CAS about 4,000 times greater than those from CWs**
4c. Comparison of Scenarios: Total GHG Emissions

- Baseline Scenario - CWs
  - 15.60 kg CO₂ e/d on winter days
  - 31 kg CO₂ e/d on summer days

- Alternative scenario –CAS
  - 884.00 kg CO₂ e/d on winter days
  - 1,635.00 kg CO₂ e/d on summer days

- Total emissions from CAS about 55 times greater than those from CWs
Conclusions

- cNES involving CWs can provide a competitive alternative to purely engineered systems for WW treatment & reuse in small or isolated communities
  - Environmentally friendly solution - significant energy savings & reduced GHG emissions compared to CAS based WWTPs
  - Adequate removal of pollutants - effluent of suitable quality for several uses

- CWs are expected to have similarly lower operating & maintenance costs compared to CAS
  - CAS process is highly mechanised and requires skilled labour & frequent maintenance
  - CWs offer construction simplicity & have low maintenance needs
    - Other limiting factors: land availability, long start-up times to reach full capacity, odour generation, mosquito problems

- Consideration of the energy consumed by the sludge treatment unit to fully analyse the energy requirements & relevant GHG emissions of a CAS system
  - Similar results to the present study are expected
  - Even greater difference between the two systems

- Further research on socio-economic, policy/regulatory factors & relevant market dynamics to boost market penetration of cNES
Acknowledgments

The research leading to these results has received funding from the EU Horizon 2020 Project AquaNES “Demonstrating synergies in combined natural and engineered processes for water treatment systems” (Grant Agreement No. 689450)

The authors also thank Dimitris Tsoukleris & the Municipality of Antiparos for providing information regarding the design and the operation of the Antiparos WWTP

Thank you for your attention!
cNES Treatment Technologies

**Pre treatment: Engineered Systems**
- Screening & grit removal
  - Two coarse screens
  - Aerated grit chamber
- Sedimentation
  - Two Imhoff tanks

**Secondary treatment: Natural Systems**
- **Two Stages of Constructed Wetlands**
  - Six sealed beds of vertical subsurface flow, planted with common reeds
    - 4 beds for stage I (460 m² each)
    - 2 beds for stage II (750 m² each)
- **Stabilization Pond**
  - Average depth: 1.5 m
  - Minimum retention time: 7 days, during winter

**Post treatment: Engineered Systems**
- Disinfection: Chlorination – Dechlorination
  - Chlorination tank: Addition of NaOCl
  - Dechlorination well: Addition of Na₂S₂O₅
