Abstract

A bacterial peroxidase-mediated oxidizing process was developed for biodegradation of total petroleum hydrocarbons (TPH) in the SBR. Complete biodegradation of high TPH concentration (7.5 g/L) attained in the bioreactor at a low amount (0.6 mM) of H$_2$O$_2$ and a reaction time of 22 h. The experimental specific TPH biodegradation rate level as high as $44.3 \text{ mg}_{TPH}/\text{g}_{biomass} \cdot \text{h}$ obtained in the process. The reaction time required for complete biodegradation of TPH concentrations of 2.5, 5, 7.5 and 10 g/L was 21, 22, 28 and 30 h, respectively. The catalytic activity of the hydrocarbon catalyzing peroxidases was determined to be 148.5 U/mg biomass. The biodegradation of TPH in seawater was similar to that in fresh media (no saline). The GC/MS analysis of the effluent indicated that all classes of hydrocarbons could be well-degraded in the H$_2$O$_2$-induced SBR. Accordingly, the peroxidase-mediated process is a promising method for efficiently biodegrading a concentrated TPH-laden saline wastewater.
